Cover Letter

Dear Confiz Hiring Team,

I am applying for the Software Engineer Level III - React JS position. With more than nine years of experience building production software, I bring direct experience with React, TypeScript, JavaScript, SCSS, Node.js, AWS, and CI/CD.

Most recently, I was the sole frontend engineer on a 15-person team, building a React and TypeScript dashboard that consolidates security findings across a Viasat platform used by 4,000+ internal users. I worked closely with backend engineers to turn complex requirements into a maintainable production application.

I have also led a five-engineer team building an AI-enabled ERP product and delivered full-stack applications for fintech, legal, and public-safety users. Across these projects, I have integrated frontend systems with APIs, improved delivery workflows, and owned features from requirements through production.

Confiz's focus on collaborative problem solving, application quality, and maintainable React systems fits how I work. I would welcome the opportunity to contribute to your team.
